                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                *Angata T., Varki N.M., Varki A.;

"A second uniquely human mutation affecting sialic acid biology.";

J. Biol. Chem. 276:40282-40287(2001).

-!- FUNCTION: Putative adhesion molecule that mediates sialic-acid dependent binding to cells. The sialic acid recognition site mase masked by cis interactions with sialic acids on the same cel
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                [mmunoglobulin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             SUBCELLULAR LOCATION: Type I membrane protein.

DOMAIN: Contains an intracytoplasmic motif referred as immunoreceptor tyrosine-based inhibitor motif (ITIM). This is involved in downmodulation of cellular functions as the termination of the immune response.

SIMILARITY: BELONGS TO THE IMMUNGLOBULIN SUBERAMILY. SIGL. (SIALIC ACID BINDING IG-LIKE LECTIN) SUBFAMILY.

SIMILARITY: Contains 2 immunoglobulin-like V-type domains.

SIMILARITY: Contains 2 immunoglobulin-like C2-type domains.

Yu Z., Maoui M., Wu L., Banville D., Shen S.H.;

"mSiglec-E, a novel mouse CD33-related siglec (sialic acid-binding immunoglobulin-like lectin) that recruits Src homology 2 (SH2)-domain-containing protein tyrosine phosphatases SHP-1 and CRACE.
   molecules.
SUBUNIT: Homodimer; disulfide-linked. Interacts with PTPN6/SHP-1
and PTPN11/SHP-2 upon phosphorylation.
SUBCELLULAR LOCATION: Type I membrane protein.
TISSUE SPECIFICITY: Expressed by monocytic/myeloid lineage cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             480

This motif is involved in downmodulation of cellular functions as the termination of the immune response. The phosphorylated ITIM motif binds to the SH2 domain of PTPN6/SHP-1 and PTPN11/SHP-2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           levels in kidney and lung.

The Submitted (OCT-2000) to the EMBL/GenBank/DDBJ databases.
C i-- FUNCTION: Putative adhesion molecule that mediates sialic-acid dependent binding to cells. Preferentially binds to alpha2,3- or 2,6-linked sialic acid. The sialic acid recognition site may be analysis of interactions with sialic acids on the same cell

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    (neutrophils and monocytes but not eosinophils). Found in liver, fetal liver, bone marrow, placenta, spleen and in lower levels in skeletel muscle, fetal brain, stomach, lung, thymus, prostate, brain, mammary, adrenal gland, colon, trachea, cerebellum, testis, small intestine and spinal cordon.

1. DOMAIN: Contains an intracytoplasmic motif referred as immunoreceptor tyrosine-based inhibitor motif (ITIM). This motif is involved in downmodulation of cellular functions as the termination of the immune response.

2. SIMILARITY: BELONGS TO THE IMMUNOGLOBULIN SUPERFAMILY. SIGLEC (SIALIC ACID BINDING IG-LIKE LECTIN) SUBFAMILY.

3. SIMILARITY: Contains 1 immunoglobulin-like V-type domain.

3. SIMILARITY: Contains 2 immunoglobulin-like C2-type domains.
                                                                                                                                                                                                                                      Genew;

                                                                                                                                                                            TISSUE SPECIFICITY: Expressed at high levels in placenta and syncytictrophoblastic cells) and at lower levels in speripheral blood leukocytes (predominantly B-cells) and sintestine.

DOMAIN: Contains an intracytoplasmic motif referred as immunoreceptor tyrosine-based inhibitor motif (TINM). This involved in downmodulation of cellular functions as the termination of the immune response.

SIMILARITY: BELONGS TO THE IMMUNOGLOBULIN SUPERFAMILY. SI
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      FUNCTION: Putative adhesion molecule that mediates similc acid dependent binding to cells. Binds to alpha2,6-linked similc acid. The similc acid recognition site may be masked by cis interactions with similc acids on the same cell surface.

SUBCULT: Interacts with LEP.
SUBCELLULAR LOCATION: Type I membrane protein (isoform 1);

TISSUE SPECIFICITY: Predominantly expressed by resting and activated natural killer cells and at lower levels by grant and monocytes. High expression found in placenta, liver, list, and peripheral blood leukocytes.

DOMAIN: Contains an intracytoplasmic motif referred as monocytes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 SUBUNIT: Interacts with PTPN6/SHP-1 upon phosphorylation SUBCELLULAR LOCATION: Type I membrane protein.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        disialyl GalNAc lactotetraoslylceramide). The sialic acid recognition site may be masked by cis interactions with sialic acids on the same cell surface. In the immune response, may act as an inhibitory receptor upon ligand induced tyrosine phosphorylation by recruiting cytoplasmic phosphatase(s) via their SH2 domain(s) that block signal transduction through dephosphorylation of signaling molecules. Mediates inhibition of natural killer cells cytotoxicity. May play a role in hemopolesis. Inhibits differentiation of CD34+ cell precursors towards myelomonocytic cell lineage and proliferation of leukemic myeloid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  FUNCTION: putative adhesion molecule that mediates sialic-acid dependent binding to cells. Preferentially binds to alpha2, 3 and alpha2,6-linked sialic acid. Also binds disialogangliosides (disialogalactosyl globoside, disialyl lactotetraosylceramide and disialyl GalnAc lactotetraoslylceramide). The sialic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Immunoreceptor tyrosine-based inhibitor motif (ITIM). T
is involved in downmodulation of cellular functions as
termination of the immune response. The phosphorylated
binds to the SH2 domain of PTPN6/SHP-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Event-Alternative splicing; Named isoforms-4; Name-1; Synonyms-AIRM-1h.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         CAUTION: Ref.3 sequence differs from that shown frameshift in position 406.

DOMAIN: Contains an intracytoplasmic motif referred as immunoreceptor tyrosine-based inhibitor motif (ITIM). T is involved in downmodulation of cellular functions as termination of the immune response.

SIMILARITY: BELONGS TO THE IMMUNOGLOBULIN SUPERFAMILY. (SIALIC ACID BINDING IG-LIKE LECTIN) SUBFAMILY. SIMILARITY: Contains 3 immunoglobulin-like V-type domai SIMILARITY: Contains 3 immunoglobulin-like C2-type domai
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Surface.
SUBCELLULAR LOCATION: Type I membrane protein.
TISSUE SPECIFICITY: Expressed by monocytic/myeloid lineage cells.
Found at high levels in peripheral blood leukocytes, spleen, bone marrow and at lower levels in lymph node, lung, appendix, placenta, pancreas and thymus. Expressed by monocytes and neutrophils but absent from leukemic cell lines representing earl
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      604200;

-!- FUNCTION: Putative adhasion molecule of myelomonocytic-derived cells that mediates sialic-acid dependent binding to cells. Preferentially binds to alpha2,6-linked sialic acid. The sialic acid recognition site may be masked by cis interactions with sialic acids on the same cell surface. In the immune response, may act as an inhibitory receptor upon ligand induced tyrosine phosphorylation by recruiting cytoplasmic phosphatase(s) via their SH2 domain(s) that block signal transduction through dephosphorylation of signaling molecules. Induces apoptosis in acute myeloid leukemia (in vitro).

SUBUNIT: Interacts with prpns / orr
                                                                                                                                                                                                                                                                                    Vitale C., Romagnani C., Puccetti A., Olive D., Costello R., Chiossone L., Pitto A., Bacigalupo A., Moretta L., Mingari M.C.; "Surface expression and function of p75/AIRM-1 or CD33 in acute myeloid leukemias: engagement of CD33 induces apoptosis of leukem
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gene

-! SUBCELLULAR LOCATION: Type I membrane protein.
-! TISSUE SPECIFICITY: Monocytic/myelold lineage cells.
-! DOMAIN: Contains two copies of an intracytoplasmic motif referred as immunoreceptor tyrosine-based inhibitor motif (TIIM). This motif is involved in downmodulation of cellular functions as the termination of the immune response. The phosphorylated ITIM motif binds to the SH2 domain of prpN6/SHP-1 and/or PTPN11/SHP-2.
-! SIMILARITY: BELONGS TO THE IMMUNOGLOBULIN SUPERFAMILY. SIGLEC (SIALIC ACID BINDING IG-LIKE LECTIN) SUBFAMILY.
-! SIMILARITY: Contains 1 immunoglobulin-like C2-type domain.
-! DATABASE: NAME-PROW; NOTE-CD guide CD33 entry; WMW="http://www.ncbi.nlm.nih.gov/prow/cd/cd33.htm".
                                                                                                                                                                                               MOD_RES

gene clusters. 76:45128-45136(2001).

J. Biol. Chem. 276:45128-45136(2001).

-!- FUNCTION: Putative adhesion molecule that mediates sialic-acid dependent binding to cells. Preferentially binds to alpha2,3-linked sialic acid. The sialic acid recognition site may be masked by cis interactions with sialic acids on the same cell surface.

-!- SUBCELLULAR LOCATION: Type I membrane protein.

-!- TISSUE SPECIFICITY: Predominantly expressed by immature monocytic/myeloid lineage cells in bone marrow. Also found at lower levels in mature neutrophils and monocytes.

-!- DOMAIN: Contains an intracytoplasmic motif referred as immunoreceptor tyrosine-based inhibitor motif (ITIM). This motif is involved in downmodulation of cellular functions as the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Matches

Preferentially binds to alpha2,6-linked sialic acid (By similarity). The sialic acid recognition site may be masked interactions with sialic acids on the same cell surface. SUBCELLULAR LOCATION: Type I membrane protein.
